DETAILED ACTION

Election/Restrictions

Applicant's election of Group I, claims 1-24, in the reply filed on December 05, 2005 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over WO9525821 to Dulaney in view of USPN 6,200,689 to Ferrigno et al. Dulaney describes laser shock peening comprising the use of a high fluence laser beam and a

Art Unit: 1725

low fluence laser beam in order to reduce edge effects. The low fluence peening can be performed at the periphery of the high fluence peening area. Ferrigno et al show (Figure 8) laser shock peening which is performed with a beam that is normal to a surface in one area and wherein the beam is progressively angled as the beam transitions to a peripheral area. The use of angled beams in the Dulaney peening process would have been obvious at the time applicant's invention was made to a person having ordinary skill in the art because it provides a method of transitioning from the deeply peened area to the peripheral area. The instant claimed fluence, number of rows of peened spots, and operating power would have been obvious at the time applicant's invention was made to a person having ordinary skill in the art depending on the particular tools and work pieces selected for peening.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The cited art pertains to laser processing.
